Abstract

Rehabilitation treatment is a significant process of solving the issues of child development. This treatment helps the education sector effectively and some various therapies are included here. These are mainly occupational therapy, physical therapy and speech therapy. Additionally, it has been seen that speech therapy supports Children in growing their communication skills that helps the child's in explaining their expression in front of people. This study mainly aims to develop the rehabilitation treatment about Reattach therapy in improving their education process. Therefore, this paper tried to show the major competition which are mainly involved in the middle of this project. This study focused on grabbing the process of secondary data collection method for the execution of the overall project in the proper way. Through following the previous documents conducted results, this study collected all data and included them in this project. Apart from that, it has been seen that this paper has focused on creating active findings for making this paper authentic. Good health diagnosis system also supported the child in developing their physical structure properly and this helped the child to grab more knowledge from different sources.

Keywords: Reattach Therapy, Occupational Therapy, Physical Therapy.

1. Introduction

Reattach therapy is one of the best theories that are utilized to handle conditions variety involving conduct disorder. This is an approach of multidisciplinary that involves different use techniques and these are cognitive therapy behavioral, neurofeedback and hypnotherapy. Additionally, this paper also sheds light on using the ReAttach theory in solving the issues of education of those children who have some disabilities also. In addition, most of the time, it has been seen that children are faced with issues related to ADHD, dyslexia and the major spectrum disorder of Autism. These kinds of disabilities affect the children in grabbing education. In order to solve this disability, this paper uses the therapy of ReAttach which supports most in solving these kinds of education problems. Besides it, the special education process is one of the best ways of fixing these vulnerable problems and through the ReAttach theory authority can meet those physically disabled children. Medical therapy is also enlisted here to solve this kind of issue for the child. Additionally, Rehabilitation treatment is another process of solving this vulnerable issue of children and physical therapy, speech-language theory, and occupational theory are also involved under the section on rehabilitation theory for serving special treatments to children. In support of these, the paper aims to develop the literature review section through elaborating on the previous studies' measured outcomes. On the other hand, parents have a crucial part in developing the child actively and these three rules are connected most to meet the child's needs accurately. Apart from that, this study also concentrates on

showing the exact methodology process for developing this project. Some theories are implemented in this study for demonstrating the paper's context in detail. Lastly, the paper also forecasts presenting actual findings from all aspects.

2. Literature Review

Rehabilitation services in Education settings for disabled child

People rehabilitation with disabilities may be shortened as defining to enhance physical, mental and sensory ally into as normal and full life as is suspected. In this case, two groups have a major role in executing the overall process and these are teachers and parents. In the role of the teacher in this case, the teacher needs to assess the child's issues respectively and focus most on their necessities. Additionally, some children can be treated differently such as those who belong to the category of disabilities. They are not the same as others in comparison culturally, socially and economically. On the other hand, teachers need to share their concentration more and more with those types of different students to treat them properly. In other words, it has been seen that besides the teacher, the child's parents also have a major role in this work aspect. In this context, acknowledging the responses related to emotions is one of the vital aspects that help to mitigate the child's disabilities. Such as, in the time of burning any Childs that time their parents require to understand their emotional attitudes without any conversation. Celebrating the child is another good process that helps the child develops actively[3]. Thus, parents need to focus on enjoying moments with their kids and this supports children to improve them self. Additionally, another good aspect is "facilitate early diagnosis", which is also involved here respectively. This way mainly forecasted on showing the concern by their parents for maintaining their children's health and feeding strategy. Therefore, for meeting all these protocols actively, parents need to consult with a good diagnosis. In support of these, speech therapy is one of the best processes for solving the disorder of children's language and speech problems. In other words, it has been seen through this rehabilitation treatment, these vulnerable problems can be solved efficiently. This therapy supports the Childs to speak fluently with others and therapy helps them to express their feelings with someone in an effective manner [4]. Apart from that, the special education servers need to forecast on inspecting the overall speech treatment accurately.

In other words, it has been seen that occupational theory is another key aspect of rehabilitation treatment that is also included in this significant paper. This major theory helps the child to maintain their daily activities properly such as playing, eating and dressing. Therefore, these three major components are playing a crucial role in developing the child's activities massively and these three aspects throw power to the child to run their life with full accuracy. It has been seen that these two major therapies have also helped child development actively. Majorly, parents and teachers both need to focus most on sorting their disabilities issues. On the other hand, another major therapy also enlisted here and the therapy name is physical therapy [9]. This is one of the popular therapies that are enlisted in the section below the treatment of rehabilitation. This therapy has an essential role in enhancing the child's strength actively and this theory also provides a good level of strength in developing the gross motor skills of children. Therefore, it has been seen that this therapy also supports the Childs in solving their disabilities in their education. Besides that, this is one of the best approaches for detecting the child's needs. Thus, it has been proved that these respective three therapies are connected appropriately with Reattach therapy. These three major therapies support the Childs in increasing the ability of communication skills and body strengths, flexibility also through utilizing Reattach therapy.

3. Methodology

Methodology is one of the major aspects that help the paper in completing the study with inputting appropriate and relevant information regarding all over topic. Most of the time, for executing this kind of paper, a secondary qualitative method is used respectively and this process is defined as the method of collecting the important data from previously conducted study. Apart from that, this study also sheds light on showing the relevant data about some therapy of rehabilitation such as occupation theory, physical theory and ReAttach theory. In other words, it has been seen that this paper also described this overall paper through following the descriptive styles [10]. The inductive approach is another good research approach that supports this paper widely in making appropriate conclusions. Besides that, this study also gathered reliable and authentic data that signifies a perfect authentication

of this valuable project [11]. In contrast, any irrelevant data are not enlisted here and this is a key point of demonstrating this study appropriately. In other words, it has been seen that this study also followed the positivism philosophy for showing all critical context in a detailed amount. Probably, this study focuses on showing the major roles of serving special education to Childs through grabbing the information from all conducted previous study. Google scholar journals and relevant articles are accounted for under the section of collecting resources. In addition, this study also presented relevant data related to various disorders of Childs. Therefore, this study tried to make this authentic most through following a perfect data collection method for this exact paper.

4. Findings and Discussion

According to the overall context, it has been presented that rehabilitation treatment is one of the major processes that helps the child's development accurately. In addition, this treatment is most responsible for those children who belong to the category of disabilities. Besides that, it has been proved that in this study, the therapy of ReAttach is one of the famous and well-known therapies that are able to serve support to the disabled Childs such as social skills of communication, emotional regulation along with sensory execution [5]. In addition, this therapy is helpful and unique most to help them with their education also. In this case, it has been discovered that this therapy also provides a lot of support in detecting the special needs for those weak Childs [6]. On the other hand, from this paper, it has been found that some major therapies are enlisted here and these are occupational theory, speech therapy and physical therapy. Speech therapy is a key therapy of helping children in serving lots of support in improving their communication skills prominently. Speech therapy is generally served through the support of their parents and their children. Apart from that, it has been discovered that speech therapy provides essential skills to embrace communication skills appropriately to children. Additionally, in expressing their emotional feelings, this therapy also played a major role. Along with that, it has been seen also from this study, this speech therapy needs to give the children the ability to express their exact emotions respectively. This collaborative nature of children helps the children with disabilities to sort out their problems without anyone's help.

Additionally, it has been collected from this study; occupational therapy is another big one that helps children in their growth. In the form of this paper, occupational therapy is used appropriately in developing the child's strength. Therefore, it has been seen that children have faced several issues in their daily life schedules such as dressing and eating, and so forth. Therefore, this occupational therapy plays a significant role in improving a child's daily routine structure effectively [7]. It has been seen that this major therapy supports the children to make their activities follow a routine basis and this work is done by their parents' guides. By following this therapy, their parents can meet their child's disabilities and this paper addressed those effective roles widely. In other words, it has been acquired that this study also focused on showing the role of the actual diagnosis system for children and a perfect diagnosis system supports the children to learn more accurately. In support of these facilities, this major therapy can support the child to embrace their flexibility also. Feeding is another major aspect of maintaining the health system of children and this therapy is accounted most for sorting the issues of diagnosis [9]. Additionally, physical therapy is another important and major key theory that helps children to solve their problems related to strength, mobility and flexibility. This key theory also supported Childs in improving the gross motor capabilities of Childs. Generally, gross motor skills are involved with various works such as climbing stairs and playing sports [8]. On the other hand, these kinds of motor skills are responsible enough for doing heavy work in their daily life. Therefore, parents provide this major therapy support to their Childs to enhance their skills. In other words, this therapy treats Childs individually as per their needs yet, this therapy is provided by medical professionals. Therefore, from this paper, it has been evaluated that Reattach therapy is one of the major aspects in present days that is enough to provide a huge amount of support to children with their sorting disabilities. Besides this, this paper sheds light on showing all major aspects in this study for elaborating the child treatment.

Children are compliant on a significant basis in wearing the device that has been provided to them. Most of the children mainly use their devices for maintaining the consistency of the device. Among the children that have participated, almost 68 % of the children have been enrolled in certain therapies for their aural rehabilitation. These types of therapies include physical therapy and intervention therapies such as counselling. Almost 58 % of the families produce no obstacles in the purpose of accessing their therapies [1]. Insurance has become the most

important barrier to accessing these therapies. There are several barriers that have been raised among those children suffering from physical disabilities. Several participants have been receiving support in their implantation process. A single child that had not been initially supportive due to the process of prior implantation has been implanted at a later stage. This continues to be preferred in the usage of implantation among disabled children. Communication skills play an important role in post and pre-implantation. These skills have been identified by different families that have described their child's implantation with proper care.

5. Discussion

From the above study, it can be discussed that there are several children at the present time that are suffering from certain physical disabilities. These disabilities often lead to certain limitations such as lack of proper education, and access to different sources that normal children can afford to enjoy. Their families perceive additional disabilities that could be attributed to their cochlear implantation. This study has focused on the vast amount of children that provided significant awareness in their environments. Participants of these studies are a group of motivated families that could bring their children to different therapies on a continuous basis. Involvement in their therapy typically involves the benefits that could reinforce their efforts of working towards their goals. Several families are aware of their implantation process in reducing their child's disabilities that could be aware of the potential outcomes in their variability [2]. Children have several challenges with their disabilities due to predicting cochlear implantation. Several observations have been done by the parents, teachers and caregivers that specifically monitor the impact of implantation on their children. The expanding criteria that are implanting consist of children that are multiple handicaps and therefore receive implantation that is cochlear. The present study implements that most of the children are required to make significant progress at a slower pace without facing any additional disability.

Additionally, it has been explained that nowadays children have suffered from various disabilities and these are mainly caused by some vulnerable issues. Most of the cases, children face issues related to communication with their parents and teachers. This issue acts as a barrier in the time sphere of collecting any knowledge from the education sector. Therefore, this study has focused on showing the major rehabilitation treatment in providing special education to those students who are physically not strong. Previous papers have focused on this topic context, however, they have not clarified the overall aspects in detail. Apart from that, it has been seen that this paper mentioned speech therapy for helping the child to develop their skills actively. By grabbing the skills related to speech, children can improve their communication skills properly and they also express their feelings to their parents or teachers. In that case, this supports the students in developing their problem-solving skills through better communication. In contrast, other papers have not discussed these kinds of effective points in their study and they enlisted some key techniques lightly. In addition, the children have suffered from the disabilities of low strength in their body and that is one of the key aspects that is covered by this study with full of competence. Besides that, previous projects produced good findings by mentioning these vital issues in their study. Occupational therapy is another major rehabilitation treatment that supports the child in developing their abilities appropriately and this significant therapy helps the child in their feeding process, and well nutrition process. Therefore, it has been seen that this paper has concentrated on the role of parents and teachers effectively in enhancing the child's development. On the other hand, other papers have failed to demonstrate these effective therapy roles or activities in their study. Physical therapy is another one that is enlisted in this entire paper as a major component of rehabilitation treatment. Therefore, it has been seen that this paper has focused on all good aspects that helped this paper to make perfect actively. Physical therapy supports the child to handle their daily routines with full efficiency. In other words, Reattach therapy is another key aspect that supports this paper in a proper way, through implementing this effective theory this study has presented the all-over process of increasing the child's ability from mitigating their disabilities problem. Thus, for these valuable reasons, this paper acted as a major paper with contrasting other papers.

6. Conclusion

According to the overall context, it can be concluded that rehabilitation treatment is one of the useful processes that supports people in sorting the issues associated with a child's disabilities. Besides that, in the present day

children have faced various kinds of issues from their disabilities and these issues are mainly impacted on their education side. Therefore, this paper has tried to make this study by mentioning the key techniques of rehabilitation treatments such as occupational therapy and speech therapy, physical therapy[12]. Apart from that, this significant study also focused on showing the major aspects of ReAttach therapy for solving their disabilities. On the other hand, it has been seen that speech therapy helped the child to improve their skills related to communication and this is one of the key skills that is able to embrace the confidence of expressing any problems in front of parents and people. On the other hand, this study also mentioned the role of parents and teachers which are under the context of rehabilitation therapy. Therefore, this paper tried to show the all context with active style and showing the individual roles in increasing the child development.
